CHEMISTRY

(Honours)

Paper : CHE-HC- 5016

(Organic Chemistry-IV)

Full Marks : 60

Time : Three hours

**The figures in the margin indicate
full marks for the questions.**

1. Answer the following questions :

(any seven)

1×7=7

- (a) What is the most stabilizing force for nucleic acids ?
- (b) Which property is commonly shared by GDP and AMP ?
- (c) Name *one* Ketogenic amino acid.
- (d) Which enzyme helps in the formation of phosphodiester bond ?

Contd.

(e) Statin drug is an example of _____ inhibition. (Fill in the blank)

(f) In which site of the cell-beta oxidation takes place ?

(g) Give an example of complex lipid.

(h) Through which process energy is obtained by red blood cells ?

(i) How many chiral centres are present in Ibuprofen molecule ?

(j) What are stop codons ?

(k) Name *one* enzyme which is secreted by the pancreas.

(l) Name what class of drug is ranitidine ?

2. Answer the following : (**any four**) $2 \times 4 = 8$

(a) Draw the base present in deoxyadenosine monophosphate and deoxyguanosine monophosphate.

(b) Write the significance of base-pairing in DNA.

(c) Give *one* example of biologically important peptide and write *at least two* functions.

- (d) What happens when an α -amino acid is heated ? Write reaction.
- (e) How are lipids classified ?
- (f) What is the root cause of malaria ? Write the structure of *one* antimalarial drug.
- (g) Draw the structure of NAD^+ and NADH .
- (h) Write *one* function each of NAD^+ and FAD .

3. Answer ***any three*** of the following :

5×3=15

(a) Describe the double helical structure of DNA. Anticodon is present in which type of RNA ? 4+1=5

(b) (i) Give the structure of Lysine. Find the isoelectric point of Lysine of which pK_{a1} is 2.18 pK_{a2} is 8.95 and pK_{a3} is 10.53.

(ii) How many tripeptide bonds are formed by various combination of Gly, Ala and Phe ? Explain.

3+2=5

(c) Write briefly about classification of enzymes. How active sites are subdivided ? $4+1=5$

(d) Hydrolysis of ATP results in release of energy. Explain.

(e) What is respiratory quotient of foodstuff ? What does it signify ? $3+2=5$

(f) What are narcotics and non-narcotics drugs ? Give example of each type. Write chemical name of Analgin and its uses. $3+2=5$

(g) What are tetracyclines ? How it is different from streptomycin ? Give an example of tetracycline. $2+2+1=5$

(h) (i) What happens when an α -amino acid is allowed to react with formaldehyde ? What is the significance of this reaction ? 3

(ii) What is chrome protein ? Give an example. 2

4. Answer **any three** : 10×3=30

(i) (a) Write *one* method of each synthesis of Adenine and Thymine.

(b) Describe a method how the C-terminal residue of a polypeptide chain can be analyzed.

(c) Name *one* amino acid which is not found in α -helix. 5+4+1=10

(ii) (a) Explain the process of protein biosynthesis (Translation). 5

(b) Describe a method of synthesis of peptides along with the different steps and reactions involved. 5

(iii) (a) Explain competitive and non-competitive inhibition of enzyme with examples.

(b) Name *one* metalloenzyme with its specificity.

(c) What is special about allosteric inhibition ? 6+2+2=10

- (iv) (a) Find the products of the following reactions of fats/oils : $1\frac{1}{2} \times 2 = 3$

- (b) Explain acid value and iodine value of oils or fats. Why these two parameters are important ?

$2 \times 2 = 4$

- (c) What are isozymes ? Explain with example.

3

- (v) (a) Write the major steps involved in glycolysis indicating the enzymes that regulate the process.
- (b) What is citric acid cycle ? Draw the cycle with different intermediate formed. How many ATPs are produced during one cycle ? $5+(4+1)=10$
- (vi) (a) Write different steps involved in the synthesis of chloroquine.
- (b) How chloramphenicol can be prepared from a suitable substrate ?
- (c) What is ranitidine ? What are the side effects of using antacid for long ? $4+4+2=10$
- (vii) (a) Show diagrammatically A-T and G-C base pairing.
- (b) Write the structure of the bases found in RNA.
- (c) Write the structure of dAMP.
- (d) Describe the solid-phase synthesis of peptides. $3+2+1+4=10$

- (viii) (a) Write a method of synthesis of paracetamol.
- (b) Mention *four* qualities that an antibiotic must possess.
- (c) Point out the essential difference between oils and fats.
- (d) Mention *one* medicinal value of turmeric and neem.
- (e) What do you mean by rancidity ? How can rancidity be minimised in foods ? $2+2+2+2+2=10$
